

How many searches must your users make to locate the information they need? Searching your library's local collection, other libraries' catalogs, popular Web search engines, journals, databases, some of the 5,000 free and licensed information services – even booksellers – will yield helpful results.

But what if your users could make a *single simultaneous* search of these resources and locate all the useful results that the standard multi-search method might yield? That's just what SirsiDynix SingleSearch™ can offer your users – less time searching for knowledge and more time using it. A federated searching tool, SirsiDynix SingleSearch searches multiple designated information sources simultaneously, cutting search time dramatically, to locate knowledge the quickest and most efficient way possible.

### Results in a single set

Once information is located, SirsiDynix SingleSearch merges results into a single result set, all within one interface. SirsiDynix SingleSearch takes the extra step to actually *bring the information to users*, rather than just showing users where they may retrieve it. This offers users access to each resource with one click of the mouse. Users also have further helpful options available to dedupe, filter, or sort the entire list of records. By combining SirsiDynix SingleSearch with the SirsiDynix Resolver™ OpenURL tool, citations located can be seamlessly linked to full text document databases and other related information.

- Searches the universe of information simultaneously
- Maintains reliable access to resources with continuous updates through subscription-based Resource plug-ins
- Provides superior results because it speaks to each source in its native language
- Delivers results merged into a single interface for easy access and to offer users options to limit searches, sort, deduplicate, and filter
- Maximizes your searching efforts with optional Alert and WorkRoom modules

### **Clear requests, reliable access**

SirsiDynix SingleSearch gives users the best results possible in the least amount of time. By speaking to each source in its *own* language, nothing is lost in translation. The advantage is clearer requests going out, and better results coming in. SingleSearch Resource Plug-ins that manage the formatting for the query and results also maintain reliable access to the thousands of resources that are searchable within the system. These plug-ins – provided on subscription by SirsiDynix – are continuously up-to-date, which means users can always have ready access to the widest range of searchable resources.

### **SingleSearch management**

To manage SirsiDynix SingleSearch, a Web-based administrator console is provided to authorized library

staff and complete source management tasks, such as adding new electronic resource subscriptions. To make the most of your users' searching efforts, the optional Alert module will run queries at scheduled intervals and notify users when new records are located, adding the records to their WorkRoom, a location for saved searches. Also available is the Graphical Activity monitor that reports usage statistics.

### **Powerful package**

Designed to complement SirsiDynix's iBistro, iLink, and Web2 interfaces, SirsiDynix SingleSearch is also a supporting technology, along with SirsiDynix Resolver, for SirsiDynix Rooms , the pioneering context management solution that puts content into context for library users.
